

Local Tobacco Control Profiles for England

28 October 2010

A new tool developed by the Association of Public Health Observatories brings together, for the first time, a detailed picture of the burden of smoking-related disease for every local authority and primary care trust in England. The tool consists of a set of indicators detailing local smoking prevalence data, levels of smoking in pregnancy, deaths from specific tobacco-related diseases as well as hospital costs of treating tobacco related diseases and local smoking cessation data.

The data can be accessed on the London Health Observatory website, [here](#).
